

ELECTRICAL CONNECTIONS – Schematic

Relay – Normally Open – 220V – 10A

The above circuit is designed to automatically start the Vacuum Motor when any of the connected tools is powered on. Only two are shown but any number of additional tools may be added in the same way. Just repeat the circuit shown, in this case, for a Router.

A by-pass switch has been added to enable starting the Vacuum Motor independently as, for example, to have an additional pick-up point for general cleaning.

For the Saw Motor it is recommended to select a switch which will turn itself off if power is interrupted. This will save you from a nasty surprise when the situation is reestablished.
